SUBJECT: Residential and Commercial On-site Sewage Systems and
Recessional Moraines in Northeastern Indiana
Update to Memoranda of June 19, and July 18, 2001

The Recessional Moraines in Northeastern Indiana extend into northern Randolph County. Because of their presence in Randolph County, the procedures outlined by ISDH for recessional moraine soils apply to Randolph County.

However, a review of soils and recessional moraine information for Randolph County indicates that the procedure does not need to be applied countywide.

Therefore, the procedure must be applied, based on soil map unit, to the following areas in Randolph County:

- ◆ All of Township 20N, Range 12E
- ◆ All of Township 20N, Range 13E
- ◆ All of Township 20N, Range 14E
- ◆ All of Township 20N, Range 15E
- ◆ All of Township 21N, Range 12E
- ◆ All of Township 21N, Range 13E
- ◆ All of Township 21N, Range 14E
- ◆ All of Township 21N, Range 15E

If the site is in one of these areas, and if the soil map unit contains any of the eleven soil series named in my memorandum of July 18, 2001, the procedure in the flow chart must be followed. If the soil map unit does not contain any of the eleven soil series, the procedure does not need to be followed.

In addition, if the soil at a site in one of the above areas is in a soil map unit which does not contain one of the eleven soil series, but a soil scientist recognizes what may be moraine characteristics during an examination of the soils, the procedure must be applied.

If the site is outside of the areas listed above, the procedure does not need to be applied.

If you have any questions, please contact my on-site sewage disposal staff at 317-233-7177.
